DETAILED ACTION

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Accordingly, claims 1-4, 6-11, 13-17 are examined in the instant application.

REJECTION UNDER 35 USC 103

Claims 1-4, 6-11, 13-17 remain rejected under 35 USC 103 as being obvious over Hajek et al, in view of Fodstad et al, and O'briant et al, for reasons already of record in paper No: 25.

Applicant argues that Hajek et al do not teach or suggest a way to identify, screen or determine morphology of cells in suspension, and that Hajek et al teach identifying cells only when the cells are smeared on slides and stained.

Applicant argues that Fodstad et al teach a single type of antibody-particle complex for detecting a single type of target cells, and that the method performed by Fodstad et al would have a low possibility of aggregation when compared with using several types of particles. Applicant argues that Fodstad et al teach cell suspension is rapid and simple when a single type of target cell is analyzed using a single type of antibody-particle complex.

Applicant argues that there is no teaching or suggestion in either reference for performing the present method.

Applicant's arguments in paper No:26 have been considered but are found not to be persuasive for the following reasons:

Application/Control Number: 09/331,376 Page 3

Art Unit: 1642

It is noted that the claimed method is not limited to using a high concentration of cells, i.e. cells with counts of 40-50,000 cells or greater per microliter.

The claimed method is the same as the method taught Hajek et all, with only one difference, i.e. instead of smearing a sample on slides for detecting and phenotyping target cells under a microscope, the cells are in suspension while detected under a microscope.

It would have been obvious to replace the smearing method taught by Hajek et al with detection of the target cells in suspension under a microscope, because detection of the target cells in suspension under a microscope, as taught by Fodstad et al, is commonly used in the art, and would provide the same results as detection by smearing the sample on a slide, for normal cell concentration, i.e. in the range of 4-11,000 cells per microliter. One of ordinary skill in the art would have a reasonable expectation of success using a method to detect and phenotype target cells wherein the cells are detected while in suspension, because for normal cell concentration, i.e. in the range of 4-11000 cells per microliter, the cell clumping would not occur, when using different particles with different associated antigens, as taught by Hajek et al (Hajek et al, column 12, lines 37-49).

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not

mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MINH-TAM DAVIS whose telephone number is 703-305-2008. The examiner can normally be reached on 9:30AM-4:00PM.
